“RESORBA® sutures are a vital part of my everyday surgical armamentarium due to their bioinert and tensile properties. SUPRAMID ORAL and GLYCOLON® variants might be of particular interest to practitioners as all-rounders, exhibiting convenient handling traits and safe knots. When referring to a microsurgical approach in oral surgery, PVDF monofil sutures (RESOPREN®) definitely win the medal. Combining them with the multitude of needles available will add to one’s soft tissue management, making it easier to achieve predictable outcomes in hard and soft tissue grafting procedures.”

Juraj Brozović
Split
Croatia

“RESORBA® combines ultimate precision in needle production, biocompatibility and excellent handling properties of the materials and creativity in needle-thread combinations. RESORBA® sutures – my first choice in periodontal surgery when it comes to wound closure!”

Rino Burkhardt
Zurich
Switzerland

“My favorite suturing-material is RESOLON® size 5-0 with DSM 16 and 6-0 with DSMF 11. It’s a great pleasure to realize my suturing techniques with this kind of excellence. I always perform a nice wound closure with special techniques like non-interrupted suturings.”

Detlef Hildebrand
Berlin
Germany

“After receiving RESORBA® sutures for testing, I was so impressed by their handling and quality that I changed my previous type of sutures to these and I am very satisfied with them.”

Istvan Urban
Budapest
Hungary
The treatment of soft tissue to obtain correct aesthetic and functional results has high priority in all surgical interventions. Two main aspects have to be observed to achieve these priorities:

- Form and management of wound edges
- Suturing technique

Aim of the correct wound closure is to:

- protect the fresh wound from infection
- minimize disturbance of wound healing
- stabilize the wound edges during healing phase
- avoid unnecessary tension on soft tissue
- allow haemostasis
- reconstitution of the aesthetic and functional continuity of the tissue
- reducing scar formation
- avoiding tissue shrinkage and loss of tissue substance

A wound is an interruption of the tissue integrity, caused by an injury or a surgical procedure, the tissue reacts with reparation and regeneration.

- The correct repositioning of the wound edges, allows an acceleration of the healing processes
- The risk of an infection is reduced

Factors influencing wound healing (locally)

Gap between diameter of needle and diameter of thread:

- this is creating a “space”, bacteria can use as penetration portal

Structure of the Thread:

- braided sutures offer bacteria a biological niche, which are difficult to reach by the immunological defense of the body (high capillarity)

Material Source:

- Silk is a natural protein which could cause a foreign body reaction; it should not be used in dental surgery

Suture removal:

- Using a non-absorbable material, or when removing absorbable suture, the surgeon must take care, not to pull the contaminated part (knot and suture part that have been exposed to oral cavity) through the wound

OVERVIEW

Surgical suture material – suggestions for dental indications

Non-absorbable material

• long-term durability with simultaneous high biocompatibility
• optimal tissue compatibility in the body due to the careful selection of materials and refining process
• easy removal

Non-absorbable suture materials remain virtually unchanged in body tissues. Once the scar tissue of the wound edges has become sufficiently strong to hold the wound together, the doctor removes the suture material by simply pulling it out.

Absorbable material

• for tissue adaptations where the need for mechanical support is time-restricted
• problem-free disintegration and elimination
• optimum biocompatibility due to the chemical properties and refinements

Absorbable suture materials hold the wound edges in place during the healing phase. During this time their tensile and breaking strength gradually diminishes. Absorbable suture materials are broken down either by endogenous proteolytic enzymes or by hydrolysis (in the case of PGA RESORBA®, PGA resoquick™ and GLYCOLON®).

**SURGICAL NEEDLES**

RESORBA® provides a large needle range – more information on request.

**Needle body – profile and point**

### Reverse cutting needle

\( \nabla \nabla = S \)

3/8-circle = DS, DSM

special black needle = ORAL

- triangular needle cross-section
- available with PREMIUM-CUT-M

### Round-bodied cutting needle

\( \nabla = RT \)

1/2-, 3/8-circle, asymptotic or straight = HRT, DRT, GRT, ART

special black needle = ORAL

- needle point with three cutting edges, thus producing a narrow puncture canal which easily penetrates tissue

### Most common needle sizes 1:1

<table>

Numbers indicate the straight (extended) length of the needle in mm

- 1/2-circle = H
- 3/8-circle = D
- straight = G
- asymptotic = A

Used mostly

- allrounder posterior deeper layers
- allrounder anterior mucoperiost flap
- interdental
- muco-gingival surgery
DENTAL SUTURES

Designed especially for oral procedures – special suture range with black needles & coloured threats

**RESOTEX® ORAL**
- Non-absorbable monofilament suture
- Special treatment for increased suppleness
- Premium tempered black steel needle
- Available in 4/0, 5/0, 6/0, 7/0
- Various needle types

- Black needles & coloured threads
  - no distracting light reflection
  - excellent contrast in bloody environment
  - better visibility through the tissue

**GLYCOLON® ORAL**
- Absorbable monofilament suture
- Short term absorption
- Premium tempered black steel needle
- Available in 5/0
- Needles in 3/8 circle

**SUPRAMID ORAL**
- Non-absorbable polyamide suture
- Pseudomonofilament structure
- Premium tempered black steel needle
- Available in 4/0
- Various needle types

RESORBA® needles are designed for specific indications, surgical techniques, and tissue conditions.
- Atraumatic due to optimal transition between needle and thread
- Special surface treatment and precision grinding ensures minimal resistance to penetration and smooth passage through the tissue
Continuous suturings
